The Role of POCUS in Fluid Estimation in ICU Patients with AKI

Hamidreza Badeli, M.D

Pediatric Nephrologist

Professor Of Guilan University Medical Sciences

Outlines

- The main causes of fluid overload
- Organ affecting by fluid overload
- The ways of detection
- POCUS
- Advanced and POCUS

The Practice of Nephrologists

- Electrolyte disorders
- Assessment of Fluid and Hemodynamic Status

The Main organs affecting by overload

[Gregorio Romero et al; Clinical Kidney Journal, Volume 16, Issue 2, February 2023](#)

Main Causes of Venous Congestion

- Heart failure
- Right-sided heart failure
- Renal failure
- Pulmonary hypertension
- Constrictive pericarditis
- Tricuspid valve disease (stenosis or regurgitation)
- Fluid overload

Current Fluid status assessment Methods

Fluid status assessment

- Physical exam
- Signs of jugular venous distention
- Third heart sounds
- Rales
- Peripheral edema

Torino C, et al : The agreement between auscultation and lung ultrasound in hemodialysis patients: The LUST study. *Clin J Am Soc Nephrol* 11: 2005–2011, 2016.

Radiographic signs

- Pleural effusions
- Kerley B lines
- Aid in fluid status assessment
- **Natriuretic peptides**
- **Pulmonary artery catheters**

- Maw AM, et al, Accuracy of point-of-care lung ultrasonography and chest radiography in adults with symptoms suggestive of acute decompensated heart failure: A systematic review and meta-analysis. *JAMA Netw Open* 2: e190703, 2019. 10.1001/jamanetworkopen.2019.0703
- Goetze JP, et al: Cardiac natriuretic peptides. *Nat Rev Cardiol* 17: 698–717, 2020. 10.1038/s41569-020-

The Role of POCUS in Fluid Estimation in ICU Patients with AKI

Point of Care of Ultrasound ()

This method involves clinicians utilizing portable ultrasound systems directly at a patient's bedside for both diagnostic and therapeutic purposes

POCUS vs Bedside Ultrasound

KIDNEY DISEASES UKP

Point-of-Care Ultrasonography

Is It Time Nephrologists Were Equipped With the 21th Century's Stethoscope?

Advantages POCUS in Fluid Estimation

- Non-invasive
- Immediate results
- Real-time assessment of fluid status
- Repeatable

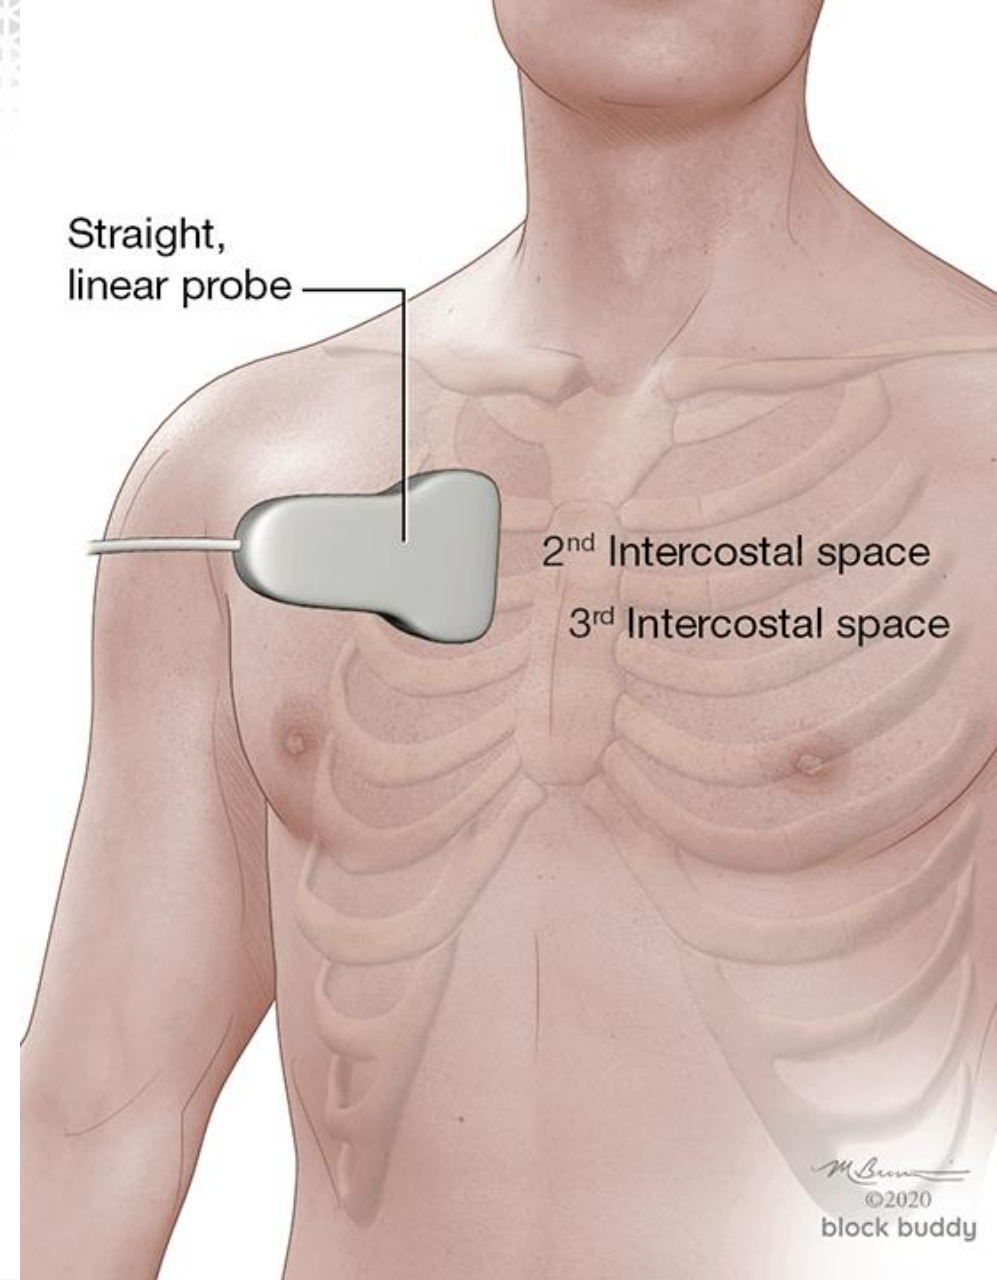

Plausible ultrasound methods for assessing affected organs

- Lung Ultrasound
- Ascites
- Venous congestion(hepatic, portal and renal veins)
- Focused Cardiac assessment including:
 1. Ejection fraction assessment
 2. Ventricular filling pressures
 3. Presence of pericardial effusion
 4. The relative heart chamber size
 5. The estimated right-atrial pressure

Argaiz ER, Koratala A, *Kidney360*. 2021;2(8):1326-1338. Published 2021 May 27.
doi:10.34067/KID.0006482020

Lung Ultrasound

Lung Ultrasound

- Organ filled with air (old edition Harrison's Book)
- In 1994 that Daniel Lishestein introduced the BLUE protocol
- The ultrasound can detect:
 - Pleural Effusion
 - Pneumonia
 - Pneumothorax
 - *Pulmonary Edema*

Kasper D, Fauci A, Hauser S et al. Harrison's Principles of Internal Medicine, 19e. Vol. 1. New York, NY:Mcgraw-Hill, 2015

Lung Ultrasound

- A-Lines
- B-lines
- **Conditions other than cardiogenic pulmonary edema:**
- Pneumonia
- Acute respiratory distress syndrome
- Pulmonary fibrosis
- Contusion

B Lines in Lung

Pulmonary Edema

Gargani, L et al., Cardiovasc Ultrasound 9, 6 (2011). <https://doi.org/10.1186/1476-7120-9-6>

LUS to detect pulmonary congestion

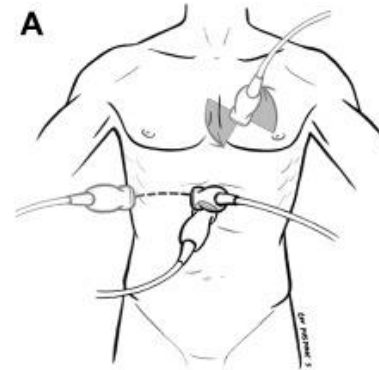

- In a study including 79 patients receiving hemodialysis who were deemed to be at higher cardiovascular risk, only about **half of** those with severe congestion on LUS (defined as >30 B-lines on a 28-zone scan) had crackles on lung auscultation.
 - In patients with moderate congestion on LUS (15 to <30 B-lines), the prevalence of crackles was only 31%
 - In patients with acute decompensated heart failure, LUS was shown to be more sensitive for detection of pulmonary edema than chest radiography, which is the typical first-line imaging
- Torino C, et al: The agreement between auscultation and lung ultrasound in hemodialysis patients: The LUST study. *Clin J Am Soc Nephrol* 11: 2005–2011, 2016.
- Maw AM, et al: Diagnostic accuracy of point-of-care lung ultrasonography and chest radiography in adults with symptoms suggestive of acute decompensated heart failure: A systematic review and meta-analysis. *JAMA Netw Open* 2: e190703, 2019. 10.1001/jamanetworkopen.2019.0703

- **Prognostic Significance:** in a multicenter observational study including 392 patients with ESKD who were on hemodialysis, those with very severe congestion (>60 B-lines on a 28-zone scan) had a 4.2-fold risk of death (hazard ratio, 4.20; 95% CI, 2.45 to 7.23) and a 3.2-fold risk of cardiac events (hazard ratio, 3.20; 95% CI, 1.75 to 5.88) after adjusting for HF class and other risk factors compared with those having mild or no congestion (Koratala A, Chamarthi G, Kazory A: Point-of-care ultrasonography for objective volume management in end-stage renal disease. *Blood Purif* 49: 132–136, 2020. 10.1159/000503000)
- **Role in Guiding the Therapy:** in patients with acute exacerbation of HF, B-line count has been shown to consistently decrease with diuretic therapy soon after presentation, thereby guiding further management (Cortellaro F, : Lung ultrasound for monitoring cardiogenic pulmonary edema. *Intern Emerg Med* 12: 1011–1017, 2017. 10.1007/s11739-016-1510-)

Inferior vena cava (IVC) Right Atrial Pressure

In patients who are spontaneously breathing

- the IVC collapses during inspiration due to negative intrathoracic pressure
- $CI = (IVC \text{ max} - IVC \text{ min}) / IVC \text{ max}$
- An IVC diameter of ≤ 2.1 cm and collapsibility of $> 50\%$ with a sniff indicates normal RAP of 3 mm Hg (0–5 mm)
- an IVC diameter of > 2.1 cm with $< 50\%$ inspiratory collapse indicates high RAP of 15 mm Hg (10–20 mm Hg),
- Scenarios in between correspond to an intermediate value of 8 mm Hg

Rudski LG, : *J Am Soc Echocardiogr* 23: 685–713, quiz 786–788, 2010. 10.1016/j.echo.2010.05.010

IVC Measurements Pitfall

- Mechanically ventilated because
- Normal collapsing
- Frail chest of elderly

IVC is a good indicator of central venous pressure (CVP) not reliable for volume status

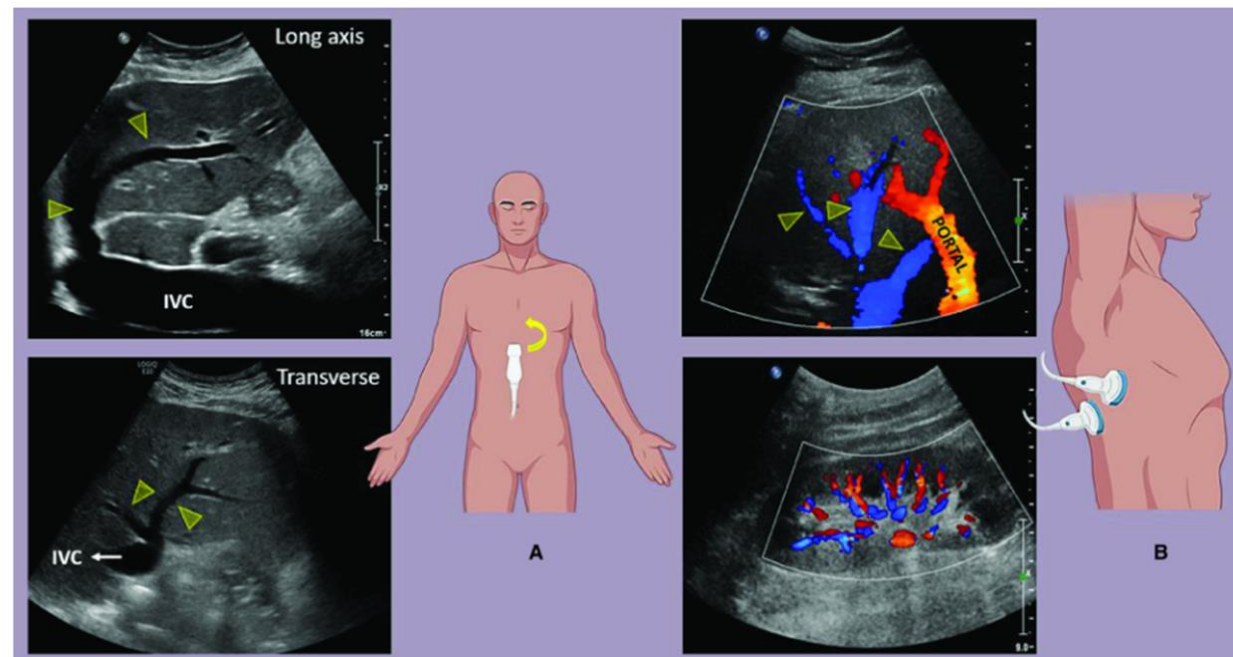

Pleural Effusion & Ascites

VExUS

Venous Excess Ultrasound

Figure 1: Systemic consequences of congestion. Abbreviations: GFR: Glomerular filtration rate. Adapted from [6].

Venous Excess Ultrasound VExUS

Interpretation

Grade 0

(no congestion)

IVC < 2cm

Grade 1

(Mild congestion)

IVC $\geq 2\text{cm}$
and any combo
of Normal or
Mildly Abnl
Patterns

Grade 2

(Moderate congestion)

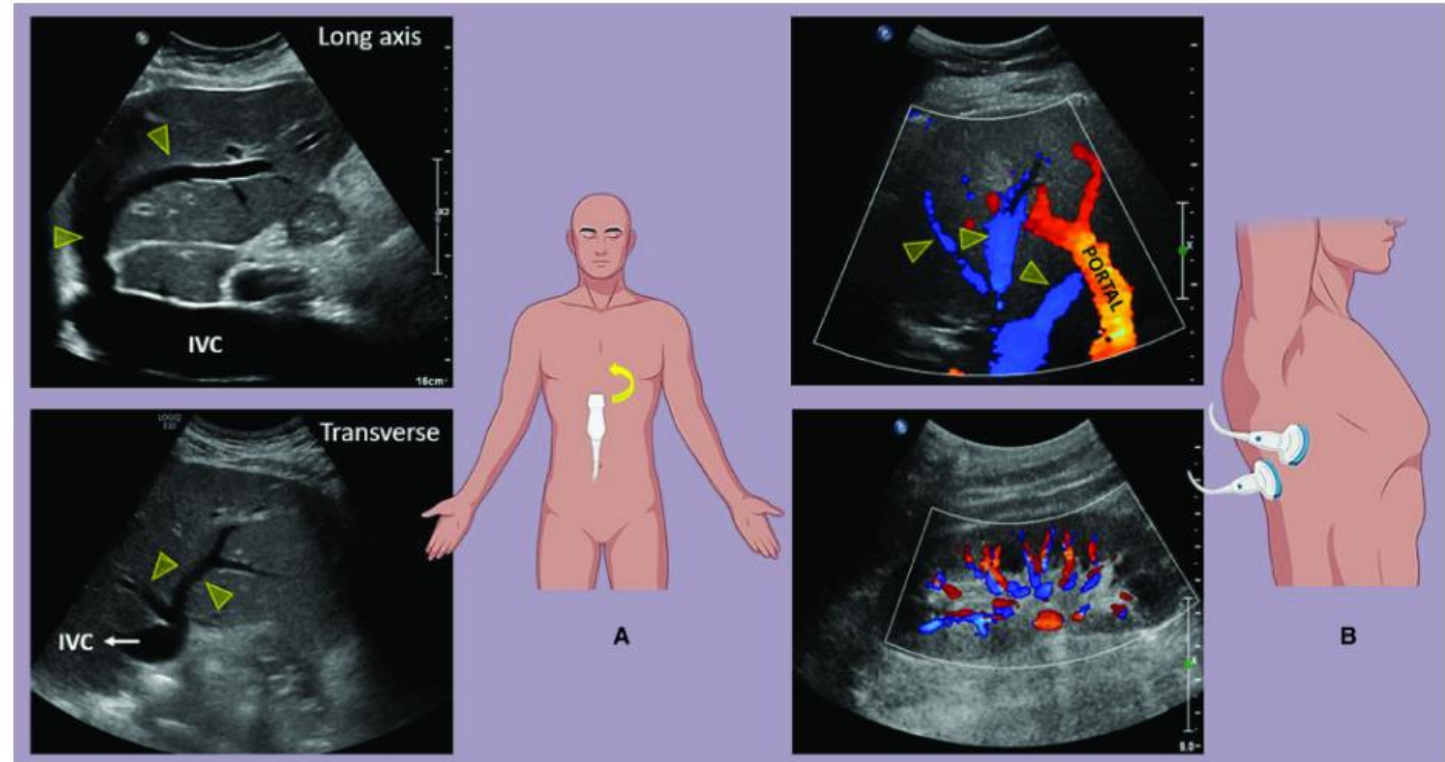

IVC $\geq 2\text{cm}$
and
ONE Severely Abnl
Pattern

Grade 3

(Severe congestion)

IVC $\geq 2\text{cm}$
and
 ≥ 2 Severely Abnl
Patterns

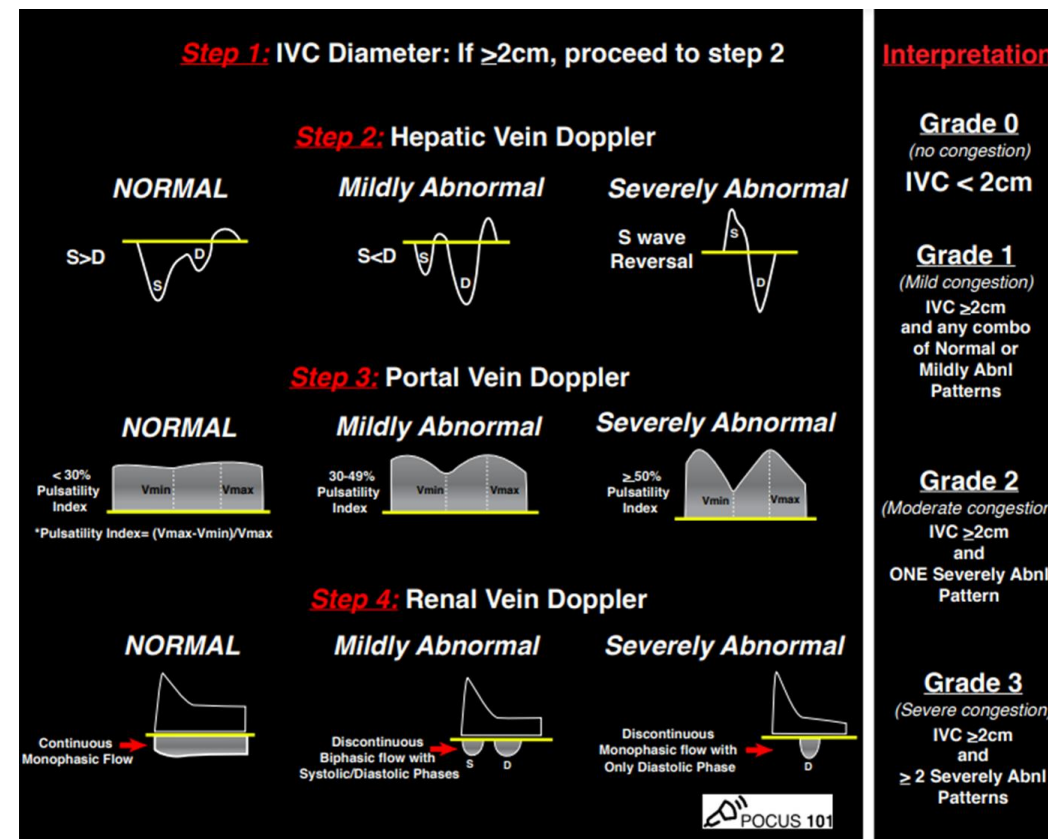

- In the original study by Beaubien-Souligny, 145 patients were evaluated for the first 72 h after cardiac surgery using the VExUS grading system [67].
- A severe VExUS grade on admission was associated with high likelihood of AKI (HR 2.82 after adjustment) and a favorable positive likelihood ratio (6.37) outperforming invasive central venous pressure monitoring.

Beaubien-Souligny W., Rola P., Haycock K., Bouchard J., Lamarche Y., Spiegel R., Denault A.Y. Quantifying systemic congestion with Point-Of-Care ultrasound: Development of the venous excess ultrasound grading system. *Ultrasound J.* 2020;12:16

VExUS Ultrasound Score:

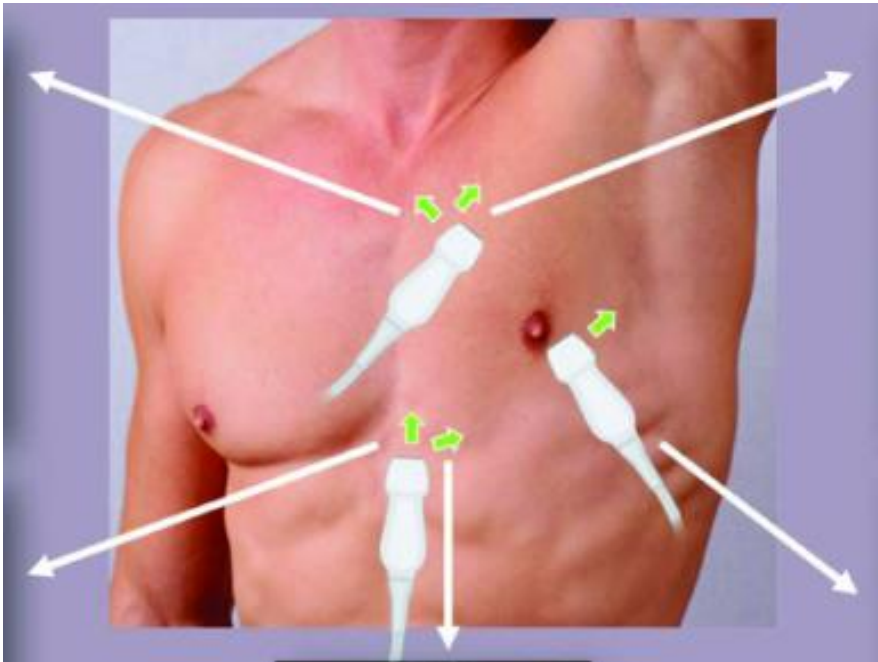

- **Grade 0**(NO Congestion): IVC $<2\text{cm}$
- **Grade 1**(MILD Congestion): IVC $>2\text{cm}$ with any combo of Normal or Mildly Abnormal Patterns
- **Grade 2**(MODERATE Congestion): IVC $>2\text{cm}$ and ONE severely Abnormal Pattern =
- **Grade 3**(SEVERE Congestion): IVC $>2\text{cm}$ and >2 Severely Abnormal Patterns =

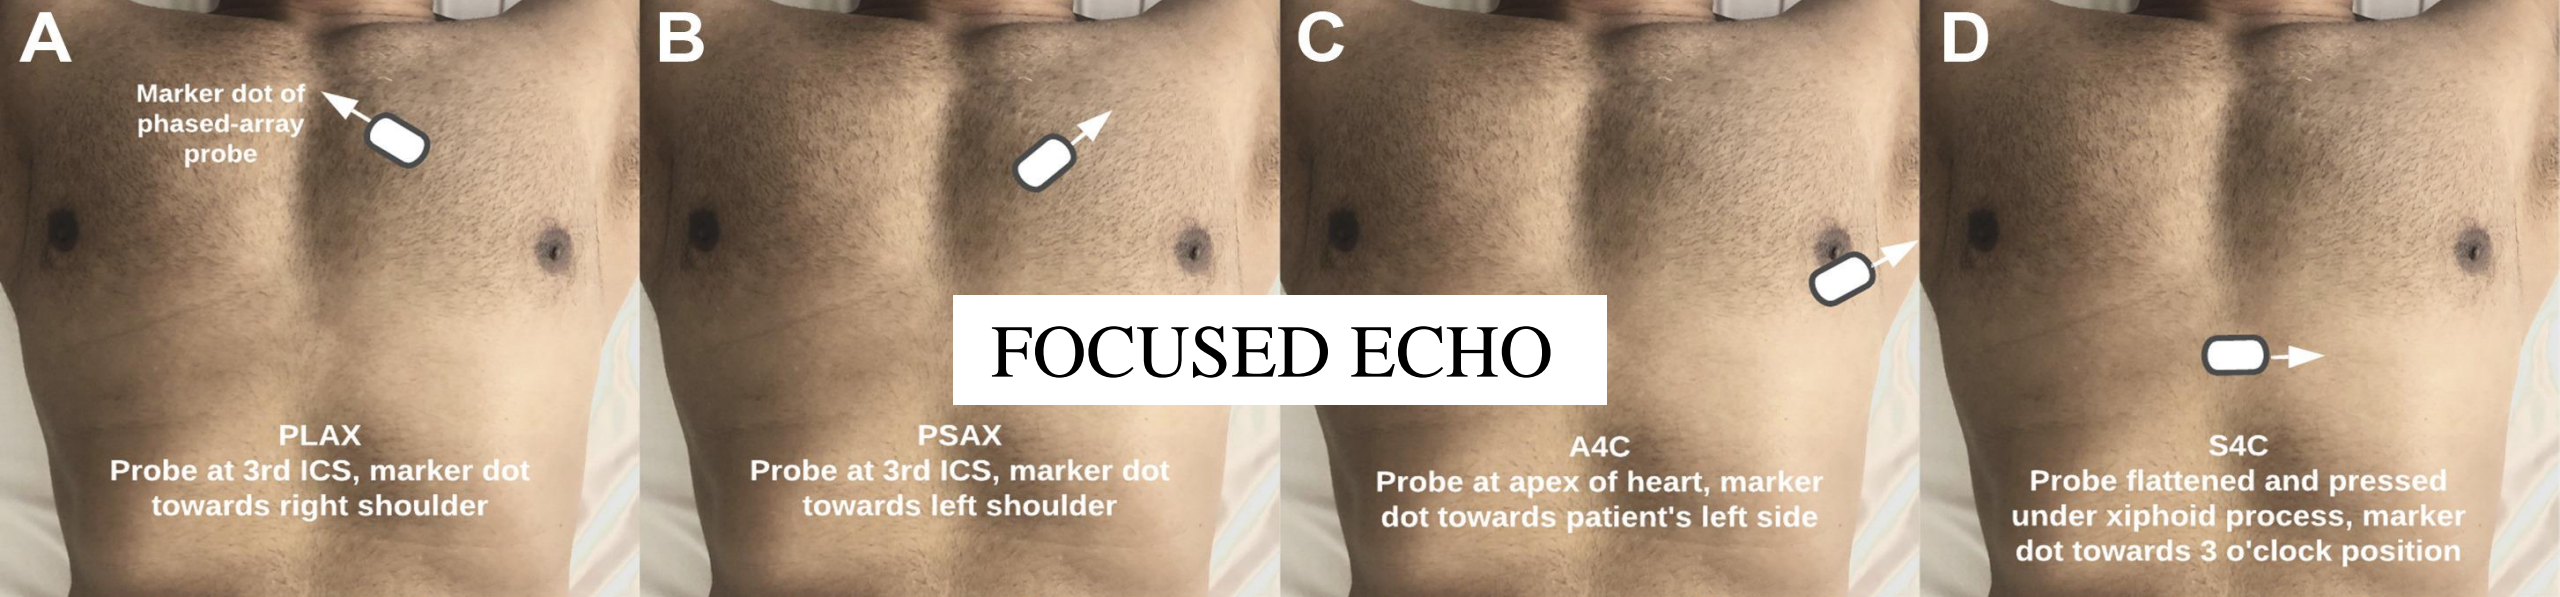

The VExUS Score

- WHAT is causing the venous congestion but
- The relative severity of end-organ venous congestion syndrome
- It then allows to know:
 1. Fluid overload
 2. Right heart failure
 3. Pulmonary hypertension
 4. Left ventricular dysfunction, etc.

Focused Cardiac Assessment

The 12th National Congress of the Iranian Society of Nephrology (NirSN)

- The left ventricle systolic and diastolic function
- Cardiac filling pressures
- The right ventricle size and function.

Is the EF normal (>50%)? PSAX

1. Estimating ejection fraction (EF)

- Eyeballing is a qualitative approach that has shown very good correlation with all formal methods routinely used to assess ejection fraction ($p < 0.001$): like:
 - AV plane displacement
 - four-chamber Simpson ejection fraction,
 - Biplane Simpson ejection fraction
 - Wall-motion score index

Gudmundsson, P.; Rydberg, E.; Winter et al, *Int. J. Cardiol.* 2005

E-Point Septal Separation (EPSS)

- The mitral-valve waveform on M-mode contains two E and A peaks:
- E-peak” is larger one and corresponds to the maximal mitral-valve opening in early LV diastole.
- The second, smaller peak is called the “A-point” and corresponds to atrial contraction later in LV diastole

<https://sjrhem.ca/advanced-cardiac-echo-a-review-of-e-point-septal-separation/>

<https://doi.org/10.1053/j.ackd.2021.04.001>

EPSS measuring EF

- A study comparing the EPSS-derived EF with the EF measured by MRI , derived the following equation:
- $LVEF = 75.5 - (2.5 \times EPSS)$ with a correlation of $r = 0.80$
- Moreover , an EPSS measurement > 7 mm demonstrated 100% sensitivity for detecting severely reduced EF ($<30\%$)

McKaigney, C.J.; Krantz, M.J.; La Rocque, C.L.; Hurst, N.D.; Buchanan, M.S.; Kendall, J.L. E-point septal separation: A bedside tool for emergency physician assessment of left ventricular ejection fraction. *Am. J. Emerg. Med.* 2014, 32, 493–497.

Mitral annular plane systolic excursion (MAPSE) for EF estimation

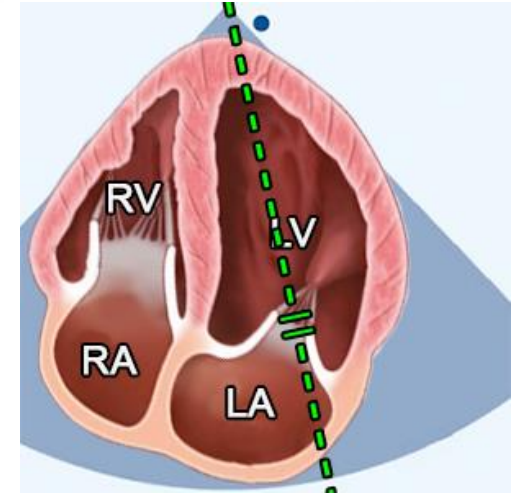

- The displacement of the mitral valvular plane in the z-direction and reflects left-ventricular longitudinal contraction or shortening
- The EF can be derived by using the following formula: $EF = 4.8 \times \text{MAPSE (mm)} + 5.8$.
- A $\text{MAPSE} \geq 10 \text{ mm}$ is considered normal EF

MAPSE = MITRAL ANNULUS SYSTOLIC PLANE EXCURSION

Left - Ventricular Filling Pressures (LVFPs)

- In the absence of hypertension, LVFP elevation is an important finding to guide the clinical assessment of volume status.
- For POCUS examinations, the trans-mitral flow Doppler is commonly used.
- The normal tracing consists of E (early rapid filling period) and A (atrial systole corresponding to the end of diastole) waves, respectively. Normally, the E-wave peak velocity exceeds that of the A wave (E/A ratio >1).

Agarwal, R. Hypervolemia is associated with increased mortality among hemodialysis patients. *Hypertension* 2010, 56, 512–517

The relative chamber size

- In the apical four-chamber view, the right atrium is equal to 1/3 of the right heart while the right ventricle represents the other 2/3.
- To assess for right-ventricular dilatation, the use of the “rule of thirds” can be applied:
- Normally, the size of the right ventricle is equal to 2/3 of the left ventricle.
- Failure to adhere to the rule of thirds indicates a dilated state of the related cardiac chamber, prompting the need to investigate the underlying pathology

Georgios Tsangaris et al, Kidney Dial. 2022, 2(2),

Pericardial effusion

- Parasternal long axis
- Parasternal short axis
- Apical four chambers
- Subcostal four chambers
